

## ABSTRACT

## Methods and apparatus for illumination of liquids in a variety of environments.

In one example, multi-color LED-based light sources are employed to achieve a wide range of enhanced lighting effects in liquids. In another example, a pool or spa is

5 illuminated by one or more multi-color light sources that may be employed as  
individually and independently controllable devices, or coupled together to form a  
networked lighting system to provide a variety of programmable and/or coordinated  
color illumination effects in the pool or spa environment.
